The IMPLUX wind turbine is designed with a vertical axis which allows it to harness the power of wind regardless of the direction. Designed by Varan Sureshan, the IMPLUX consists of an omnidirectional outer covering that directs the wind through the device to an aerofoil propeller rotor similar to those used on horizontal axis turbines.

This is a omni directional wind turbine designed to be installed outdoors on the rails of your deck or just stick it in a potted plant. This design will catch wind from all directions and the turbine does not have to face the wind.

An omni-directional, vertical-axis wind turbine which includes a rotor/stator combination which maximizes energy production by increasing wind velocity and pressure plus eliminating back pressure. The stator section includes a plurality of vortical blades secured between upper and lower conical sails. The blades have a radius fundamentally equal to that of the rotor and a ...

A system for on-site wind-solar hybrid power generation and rain water collection. The omni-direction-guide-vane (ODGV) overcomes the weak wind and turbulence conditions in urban areas. The ODGV improves the wind turbine performance by speeding-up and guiding the wind. The ODGV is designed to blend into the building architecture with safety ...

An omni-directional, vertical discharge wind turbine assembly (1) including a shroud that includes a diffuser (9) and the structure surrounding and defining the collection chamber (12) that captures wind in any direction and directs it to flow vertically via stacked curved blades of toroidal form (10a-10e). The blades (10a-10e) are secured by vertical walls (6.1-6. 3).

An omnidirectional augmented wind turbine popularly called Zephyr vertical axis wind turbine has also been investigated [10]. The augmented wind turbine studied came with a stator as well as rotor design. Power coefficient for the Zephyr turbine was deduced as 0.12. For the fact that the power coefficient was lower, these turbines were not ...

An omni directional, vertical discharge wind turbine, consisting of a shroud that captures wind from any direction and directs it to flow vertically through a throat section where an aerofoil multi-bladed rotor is mounted. The rotor shaft is connected to an electrical power generator. The intake of the shroud incorporates multiple horizontally curved blades of toroidal form varying up to ...

IMPLUX: Omni-directional, vertical axis wind turbine for urban environments. By Darren Quick. 22:34 May 12, 2011 . How the IMPLUX might look atop a building . When most people think of wind power they think of large-scale wind farms with fields of huge three-bladed horizontal axis turbines. With such farms requiring lots of room they are ...

The key to the IMPLUX, which was designed by inventor Varan Sureshan, is the omni-directional shroud that forms the outer covering of the turbine and directs the wind from all directions up ...

Like the Aeromine, the O-Wind"s design relies on Bernoulli"s principle, which is the basis for both how airplane wings achieve lift and how wind turbine blades spin. 7 That said, the O-Wind sets itself apart from other SWTs because of its ability to capture winds from any direction, on both the vertical and horizontal planes. 4
